

Assignment for Dir, Strat & Ops

Time	Format	Due
8–12 hours, self-paced	Flow walkthrough + code	In 2 working days

The Task

Build a Job Search Assistant for yourself using [Claude.ai](#). It should solve a real problem you have — finding, evaluating, and acting on relevant job opportunities. The tool must connect to at least 3 live external systems and take real actions on your behalf. Beyond that, the design is yours.

Hard Requirements

- Live data: the tool must pull real, current job listings — not mock data
- Scoring: jobs must be ranked or scored against criteria you define
- Actions: the tool must take at least one action per job on your behalf (apply, email, message, etc.)
- Connectors: minimum 3 live external systems with real read/write operations
- UI: a working dashboard (localhost is fine) where you can trigger actions per job

What to Submit

Deliverable	What We Want to See
Flow walkthrough	10–15 min. Show the tool working live — real data, a job being scored, at least one action firing.
Code	GitHub link or ZIP. Prompting history / Claude exports are a bonus.
Scoring note	Half a page: what criteria did you use, why, and what did you exclude?

Build something you'd actually use. *That's the whole brief.*
